

Quote	Participant	Code	Theme	Manifesto Principle	Included in the Paper
“We have more general agent configurations with some instructions, but each team sometimes defines its own standards for how the code should be organized, so each team would also need to create its own agent configuration file.”	P1	Adaptation of agent configurations by each team	Adaptation of Blueprints to Team and Domain Context	Reusable Blueprints, Living Knowledge	Yes
“Another problem is the tacit knowledge shared across teams. We have conventions and good practices that are not always translated into agent configuration documents.”	P1	Difficulty of translating tacit knowledge into configuration	Challenges in Encoding and Maintaining Knowledge for AI Reuse	Reusable Blueprints, Living Knowledge	Yes
“Creating a skill for the module may not work as people expect because, although the components are in the same layer, they are very different.”	P10	Limitations of creating a single skill for heterogeneous modules	Adaptation of Blueprints to Team and Domain Context	Reusable Blueprints	No
“I recently created a skill in Claude for the team. They only need to provide the context and explain what needs to be done, and then it builds a properly structured prompt for the AI planning stage.”	P2	Skill created to structure AI planning	Reusable Instructions, Templates, and Configurations	Reusable Blueprints, The New Process	Yes
“We used this prompt-engineering skill to build the action plan for executing the code.”	P2	Use of a skill to create an implementation action plan	Artifacts as Sources of Context for AI	Living Knowledge, The New Process, Reusable Blueprints	No
“I follow the template that is usually already included in BMAD. It generates the PRD using a ready-made template.”	P5	Use of a predefined template to generate PRDs	Reusable Instructions, Templates, and Configurations	Reusable Blueprints, Living Knowledge	Yes
“We have a team that specializes in AI. They created a small library with several Markdown files, basically several prompts. For example, they created a Markdown file with instructions and scripts for generating a card description, which we call a PRD.”	P6	Creation of an instruction library for generating card descriptions	Reusable Instructions, Templates, and Configurations	Reusable Blueprints, Living Knowledge	Yes
“When it is time to generate the document, it uses this template, but the idea is for the template to remain a living artifact.”	P6	Maintenance of the template as a living artifact	Adaptation of Blueprints to Team and Domain Context	Reusable Blueprints, Living Knowledge	Yes
“I am going to start working on creating a skill to see whether we can improve this part of the AI and keep it from hallucinating so much, because we spend a lot of time giving it directions, and it also takes a long time to process them.”	P10	Providing clearer guidance to reduce AI hallucinations	Challenges in Encoding and Maintaining Knowledge for AI Reuse	Reusable Blueprints, Verification-First	Yes
“The AI also uses the generated Markdown to provide context and explain the code within the conversation history.”	P3	Use of generated Markdown as conversational context	Artifacts as Sources of Context for AI	Living Knowledge	No
“For a refactoring activity, we first document what needs to be refactored. We use AI to catalog what currently works, create an architecture diagram of the current solution, and propose a new solution.”	P4	Documentation of the current architecture and proposed refactoring solution	Artifacts as Sources of Context for AI	Living Knowledge, The New Process	No
“I use planning models to generate the plan and the tasks, and then I switch to an agent model that implements that plan and carries out the tasks.”	P1	Separation of planning and execution across agents	Coordination and Division of Work Across Agents	The Extended Workforce, The New Process	Yes
“The company has internal agents built by an infrastructure team, and we use them to check whether the system is up and running.”	P2	Use of internal agents to investigate system health	Specialized Agents for Distinct Development Activities	The Extended Workforce, Verification-First	Yes
“It generates unit tests based on your project.”	P3	Generation of unit tests based on project context	Assessment of AI-Generated Code Through Testing and Review	Verification-First	No
“It understands the entire project context and can read the files, basically assuming the role.”	P3	Understanding of project context by reading files	Agents Integrated with Tools, Repositories, and Contextual Sources	The Extended Workforce, Living Knowledge	Yes
“BMAD has this Party Mode, and it manages the agents automatically.”	P5	Automatic coordination of specialized agents through BMAD Party Mode	Agents operate in integration with tools, repositories, and contextual sources	The Extended Workforce, The New Process	Yes
“In Slack AI, we have some agents that you can ask, directly from a conversation, to try to handle a small fix. The agent can use the context from both the Slack conversation and the code repository and then automatically open a PR for review.”	P9	Use of Slack agents for small fixes and Pull Request creation	Agents Integrated with Tools, Repositories, and Contextual Sources	The Extended Workforce, The New Process	Yes
“We validate it with tests, usually manual tests.”	P3	Validation through manual testing	Assessment of AI-Generated Code Through Testing and Review	Verification-First	No
“We just enter the CR ID, and then it can read the description, access the logs (...) check whether there are similar CRs (...) and when it suggests a fix, it already shows you the relevant code, so you only have to confirm and approve it”	P10	Diagnosis of Change Requests through access to logs and supporting evidence	Agents Integrated with Tools, Repositories, and Contextual Sources	The Extended Workforce, Verification-First, Living Knowledge	Yes
“If I need to change anything, I make the changes in the plan. Otherwise, I tell it to execute.”	P2	Adjustment of the implementation plan before code generation	Review of the Artifacts That Guide AI Before Implementation	Verification-First, The New Process	Yes

“During its attempts, I usually add some logs and observe what is actually happening. This debugging process has also helped me a lot.”	P4	Use of logs to inspect and debug AI-generated changes	Assessment of AI-Generated Code Through Testing and Review	Verification-First	No
“I can also ask the AI to generate the PR description, explaining what changed, why it changed, and how it fixes the error, so that whoever performs the code review already has the overall context.”	P4	Generation of Pull Request descriptions to support code review	Assessment of AI-Generated Code Through Testing and Review	Verification-First, Living Knowledge	No
“Sometimes you want a more specialized test, so you have to work on the AI prompt.”	P8	Prompt refinement for specialized testing	Assessment of AI-Generated Code Through Testing and Review	Verification-First	No
“With AI, we planned how the refactoring would be done, created documentation for the migration, validated it, fed constraints back to the AI, and then used the final documentation to generate the code.”	P4	Iterative planning, validation, and implementation of a refactoring	Incremental and Specification-Driven Use	The New Process, Living Knowledge, Verification-First	No
“We use AI to assess feasibility, brainstorm possible solutions, and write a design document. Once approved, the idea is broken into tasks, and implementation is generally carried out through AI.”	P9	Design-document-driven planning and AI implementation	Incremental and Specification-Driven Use	The New Process, Living Knowledge	No
“When we submit the PR, a service standardizes its description and then runs an automated code review using AI. We check whether what the automated review found actually makes sense, and if it does, we can accept it.”	P4	Use of automated code review followed by human validation	Quality of AI-generated code is assessed through testing and review	Verification-First, The Extended Workforce, The New Teams	Yes
“For large system changes, I first use AI to plan how to solve the problem and break down the tasks, and then I use AI to implement those steps.”	P9	Planning large changes before AI-supported implementation	Incremental and Specification-Driven Use	The New Process	No
“I used this component as a reference together with my architecture document to perform the other refactorings in my codebase.”	P1	Use of a component and architecture documentation as refactoring context	Incremental and Specification-Driven Use	The New Process, Living Knowledge	No
“I used AI from the conception stage.”	P1	Use of AI from conception	Incremental and Specification-Driven Use	The New Process	No
“I usually have to make the prompt stricter for testing. If the required coverage is very high, I also have to review the tests more carefully to see whether they actually make sense.”	P5	Review of AI-generated tests	Quality of AI-generated code is assessed through testing and review	Verification-First, The New Teams	Yes
“You first write down what needs to be done and then how it needs to be done, including more code-level details, so it can be generated more accurately.”	P6	Documentation of what AI should generate before implementation	Review of the Artifacts That Guide AI Before Implementation	Verification-First, Living Knowledge	Yes
“For a more complex task, I use planning models to generate the plan and tasks and then switch to an agent model that implements them.”	P1	Use of agents for more complex tasks	Incremental and Specification-Driven Use	The New Process, The Extended Workforce	No
“It generated the TechSpec and implemented it, but one thing we still do not have is an automated testing flow to make sure it actually works.”	P7	Lack of an automated testing flow to validate the implementation	Quality of AI-generated code is assessed through testing and review	Verification-First	Yes
“We take the full description of the card previously created by AI and build the plan, including which files will change, how they will change, and how the code will look before and after.”	P2	Creation of a detailed implementation plan from an AI-generated card	Incremental and Specification-Driven Use	The New Process, Living Knowledge	No
“It returns an answer using this basic template it already has for creating and refining stories, and then we review everything (...) the second part is deciding which tests we need to develop this, and that also comes from the AI (...) so there is all this refinement of the AI's response that we do. After that comes the development stage.”	P8	Refinement of the story and definition of tests before development	Review of the Artifacts That Guide AI Before Implementation	Verification-First, The New Process	Yes
“I entered a prompt and it began its reasoning process. It asked whether it could make changes, I accepted, and it explained what it was thinking and doing. In the end, I saved the files, compiled the project, and it worked.”	P4	Interactive use of an agent as an assistant	Incremental and Specification-Driven Use	The New Process, The New Teams	No
“For coding, we first create a plan for the AI, validate it, ask it to create a progress document, and have it mark completed steps. At the end, it must compile the code and ensure that it works.”	P4	Plan-driven implementation with progress tracking and compilation	Incremental and Specification-Driven Use	The New Process, Living Knowledge, Verification-First	No
“Every time we create a skill or some documentation, we generate a Markdown file and save it in the repository. Then, whenever we interact with it through the chat, those Markdown files become commands in the chat.”	P2	Storage of skills in the repository as commands for the agent	Traceable and Reusable Artifacts Within the Workflow	Living Knowledge, Reusable Blueprints	Yes
“Code generation, card-description generation, and Pull Request review.”	P6	Use of AI across code generation, card description, and Pull Request review	Incremental and Specification-Driven Use	The New Process, The Extended Workforce, Verification-First	No
“We currently use some Spec Kit and work with PRDs, TechSpecs, and task breakdowns. Our workflow is strongly focused on these artifacts.”	P7	Workflow organized around PRDs, TechSpecs, and task breakdowns	Incremental and Specification-Driven Use	The New Process, Living Knowledge	No
“The next step is basically this: we generate the documentation, review it, and then start coding based on it.”	P4	Documentation as the basis for starting the coding process	Reconfiguration of Team Roles and Responsibilities	The New Teams, The New Process, Living Knowledge	Yes

“A spike is a story, but it is focused on investigation (...) I investigate how I am going to implement this requirement in the existing code (...) and all of that is documented in the spike story”	P4	Use of a spike to document the implementation investigation	Artifacts as Sources of Context for AI	Living Knowledge, The New Process	Yes
“I ask it to create a progress document. In that document, it lists every step it needs to carry out, and as it implements them, I ask it to mark what it has completed. This way, it keeps a memory of what it has done until implementation is finished.”	P4	Recording of implementation steps in a progress document	Traceable and Reusable Artifacts Within the Workflow	Living Knowledge, The New Process	Yes
“The complete process would start with the first document, which we call the PRD. Then, based on the business definitions, we move on to defining how it will be built. This second document is the TechSpec.”	P6	Business documentation before the technical solution	Artifacts as Sources of Context for AI	Living Knowledge, The New Process	Yes
“I copied the CR ID into Gemini and asked for help. It provided possible analyses and solutions and then suggested a fix.”	P10	Use of AI for Change Request analysis and fix suggestion	AI-Supported Problem Diagnosis and Resolution	The New Process, The Extended Workforce	No
“It [the agent] has a plugin for Edge (...) whenever we make a change, either to the story or to the change request (...) Edge sends a request to [the agent] (...) as you edit and save, it updates everything in Jira.”	P8	Agent-driven update of stories and changes, with the changes reflected in Jira	Traceable and Reusable Artifacts Within the Workflow	Living Knowledge, The Extended Workforce	Yes
“I can take [...] this document, download it as a Markdown file, and give the whole thing to the AI. From there, I start planning”	P9	Use of a design document as input for planning	Artifacts serve as sources of context for AI	Living Knowledge, The New Process	Yes
“I can ask it to generate Python code to optimize a scripting task for Windows.”	P11	Script generation	Occasional and Reactive Use	The New Process	Yes
“I was developing and there was a function that was no longer used, so I called the AI, and it managed to solve the problem.”	P3	Targeted changes to the codebase	Occasional and Reactive Use	The New Process	Yes
“A problem document is provided, but it is not a formal requirements elicitation document. It contains some specific instructions, but it does not include details.”	P1	Informal problem documentation	Insufficient Problem Documentation for AI Use	The New Process, Living Knowledge	No
“The problem document is usually too high-level and does not become a detailed enough artifact to provide to the AI.”	P1	Problem documentation is not detailed enough for AI use	Insufficient Problem Documentation for AI Use	The New Process, Living Knowledge	No
“I use AI to code specific things, generate unit tests, and understand the codebase.”	P1	Use of AI for coding, test generation, and project understanding	Task-Level AI Support Across Development Activities	The New Process, Verification-First	No
“There is a Figma MCP server that lets us take the design and send it directly to the AI, and then it can generate the component for me without many adjustments.”	P4	Use of prototypes as specifications for AI-supported generation	Incremental and Specification-Driven Use	The New Process, Living Knowledge	Yes
“I have a framework that we use on top of AI in Cursor called BMAD. We use this framework to support everything from fleshing out the idea and creating the PRD to actually carrying out the development.”	P5	Use of a framework to guide AI-supported development	Incremental and Specification-Driven Use	The New Process, Reusable Blueprints	Yes
“I have Claude Code use the Figma MCP to read the Figma design, generate the code for that screen, and create a small document with a card-style list containing a bunch of requirements.”	P6	Use of prototypes as specifications for AI-supported generation	Incremental and Specification-Driven Use	The New Process, Living Knowledge	Yes
“The first thing I did was give the AI the tool's documentation (...) I asked it to understand the context (...) then I connected that with what we actually had in the implementation (...) after that, I asked it to create a plan (...) I kept validating what it was doing, and then I actually asked it to implement it.”	P7	Creation of an implementation plan based on documentation and implementation context	Incremental and Specification-Driven Use	The New Process, Living Knowledge, Verification-First	Yes
“I use [the company's agent] to handle the whole process of creating the story and refining it (...) then comes the development part, where I use Copilot Kit (...) the third part is building the PR (...) I use [the company's agent] for that too, to speed things up.”	P8	Use of AI across sequential stages of the development workflow	Orchestrated and Multi-Step Use	The New Process, The Extended Workforce	Yes
“I call the AI to understand what I need to do, and once I understand, I use it to help me with the steps needed to solve the problem.”	P11	Use of AI for problem understanding and resolution guidance	Occasional and Reactive Use	The New Process	No
“The company recommends letting the AI work freely, but I still prefer to review the planning step by step because reviewing everything only after it is complete is much more confusing.”	P2	Step-by-step review of AI planning	Human Oversight of AI Planning	The New Process, The New Teams, Verification-First	No
“We used AI both to transcribe meetings and to process the transcripts into cards and documentation.”	P2	Use of AI for meeting transcription and card creation	AI-Supported Transformation of Meeting Content into Development Artifacts	The New Process, Living Knowledge	No

“You take a design document and feed it into the AI. Then you create an execution plan and the tickets on your task board. You feed those tickets into the AI and start planning each one, refining what has already been refined and iterating on it.”	p9	Iterative refinement based on design documents, plans, and tickets	Incremental and Specification-Driven Use	The New Process, Living Knowledge	Yes
“The delivery of those cards was also carried out with AI, using a prompt-engineering skill to build the action plan for executing the code.”	p2	Use of AI-generated cards and a skill to plan code execution	AI-Supported Transformation of Development Artifacts Across Workflow Stages	The New Process, Living Knowledge, Reusable Blueprints	No
“When breaking down the card, we provide information from both the product and technical meetings so that the AI understands both contexts.”	p2	Use of product and technical meeting transcripts as context for card creation	Integration of Product and Technical Context for Artifact Creation	The New Process, Living Knowledge	No
“Implement the item described in the card, following the system's business rules and code standards in this repository.”	p2	Use of business rules and code standards as implementation context	Structured Context for AI-Supported Implementation	The New Process, Living Knowledge	No
“When the task is simpler, such as a correction, we can go directly to the objective and ask only for what is needed.”	P5	Direct AI use for simple corrections	Occasional and Reactive Use	The New Process	No
“I try to satisfy the business requirements provided by the Product Owner, but the PRD is ultimately written by me based on my technical understanding.”	P5	Developer combines business requirements and technical understanding to create the PRD	Human Mediation of Business and Technical Context in Specifications	The New Process, The New Teams, Living Knowledge	No
“I check line by line what it generated; I do not fully trust it.”	P3	Detailed review of AI-generated code	Human Review of AI-Generated Outputs	The New Teams, Verification-First	No
“As it suggests changes, you can save them as they are presented. It is an interactive process.”	p3	Conversational and iterative interaction with AI	Iterative Human–AI Collaboration	The New Teams, The New Process	No
“I feel that working with AI is more like a conversation, and I have to analyze what I am doing more carefully.”	p2	More careful analysis during conversational interaction with AI	Iterative Human–AI Collaboration	The New Teams, The New Process	No
“Learning a little more about how to use these tools.”	P4	Learning to use AI tools productively	Development of AI-Related Skills	The New Teams	No
“People now ask me architecture questions, but I am not an architect, so we end up doing more than we should with AI.”	P5	Informal expansion of the developer's scope	Reconfiguration of Team Roles and Responsibilities	The New Teams	No
“I am more of a reviewer nowadays than a developer.”	P5	Developer identity shifting toward reviewer	Reconfiguration of Team Roles and Responsibilities	The New Teams, Verification-First	No
“With AI, we begin to notice that we are performing roles that are not ours.”	P5	Performance of responsibilities outside the formal role	Reconfiguration of Team Roles and Responsibilities	The New Teams	No
“Before, we worked by typing and thinking through the solution; now, we tell Claude to do it.”	p6	Replacement of direct implementation with AI instruction	Reconfiguration of Team Roles and Responsibilities	The New Teams, The New Process	No
“Nowadays, I dedicate focused time mainly to generating all these documents and specifications.”	p6	Prompt and specification artifacts as central work objects	Reconfiguration of Team Roles and Responsibilities	The New Teams, Living Knowledge	No
“A large part of the time is spent writing and reviewing PRDs. Instead of reviewing a PR, I now have to review the plan that will generate the PR.”	P6	Replacement of Pull Request review with review of the plan that generates the Pull Request	Reconfiguration of Team Roles and Responsibilities	The New Teams, Verification-First, The New Process	No
“If we can refine the entire story well, the AI is already at a level where it can understand it easily and generate almost everything for us.”	p8	Quality of the story as a condition for AI generation	Reconfiguration of Team Roles and Responsibilities	The New Teams, The New Process, Living Knowledge	No
“Nowadays, the work is much more about reviewing, so I do not type (...) but I spend more time reviewing to determine whether what the AI is giving me is actually valid.”	P8	Shift from typing to validation of AI outputs	Reconfiguration of Team Roles and Responsibilities	The New Teams, Verification-First	No
“We do not really write the code itself; we write the prompt that will write the code.”	p2	Replacement of manual coding with AI guidance	Reconfiguration of Team Roles and Responsibilities	The New Teams, The New Process	Yes
“I have a little more difficulty with the part where I have to explain how I want things to work.”	p2	Difficulty of explaining to the AI how the solution is expected to work	Reconfiguration of Team Roles and Responsibilities	The New Teams	Yes
“It has definitely changed the focus. Before, the focus was on writing. Now, it is purely on reviewing, whether that means reviewing a document with a plan, reviewing the specifications for something, or reviewing the code it generated.”	p6	Review of plans, specifications, and AI-generated code	Reconfiguration of Team Roles and Responsibilities	The New Teams, Verification-First, Living Knowledge	Yes
“It has probably been three or four months since I last wrote an actual line of code.”	P7	Reduction in direct code writing	Reconfiguration of Team Roles and Responsibilities	The New Teams	Yes
“I have practically stopped writing code. It is very rare for me to write code now. I review the code, and if everything looks right, great. If not, I ask the AI to fix it.”	P5	Human review followed by AI correction	Reconfiguration of Team Roles and Responsibilities	The New Teams, Verification-First	Yes
“You end up spending a lot of time reviewing code, a lot of time on design, and very little time coding.”	P9	Increase in the time spent on design and review	Reconfiguration of Team Roles and Responsibilities	The New Teams, Verification-First	Yes
“The developer is taking on all of this responsibility. I think this has been quite harmful because the responsibilities are not clearly defined.”	P5	Unclear responsibilities in AI-supported work	Reconfiguration of Team Roles and Responsibilities	The New Teams	Yes

“Right now, I am basically doing the work of the PO (Product Owner), the architect, the developer, and the tester”	P5	Accumulation of duties	Reconfiguration of Team Roles and Responsibilities	The New Teams	Yes
“I do not need to keep asking the senior or mid-level developer questions all the time (...) I can just ask Gemini instead”	P10	Use of AI to reduce the need to consult more experienced developers for routine technical questions	Reconfiguration of Team Roles and Responsibilities	The New Teams	Yes
“The AI was unable to detect task priority and execution order, and after it had implemented a large amount of work, we had to review, correct, and create additional cards.”	P2	Creation of additional work due to late review	Consequences of Insufficient Early Verification	The New Teams, Verification-First, The New Process	No
“The method recommends letting the AI work freely, but I prefer to review the planning step by step because reviewing everything only after completion is more confusing.”	P2	Early review of plans before implementation	Review of Artifacts That Guide AI Before Implementation	The New Teams, Verification-First, The New Process	No
“All the teams' sprint cards were coordinated through AI; we created skills.”	P2	Use of skills to coordinate sprint cards	Reusable Instructions, Templates, and Configurations	Reusable Blueprints, The New Process	No
“Use the dependency injection approach configured in the specified file.”	P4	Reuse of project configuration instructions	Reusable Instructions, Templates, and Configurations	Reusable Blueprints, Living Knowledge	No
“We did not review the cards, and this caused a major problem in the sprint. Some cards depended on others, and some actions should have been taken first. The AI was unable to detect the priority and execution order of the tasks.”	P2	Failure to review task dependencies and execution priorities before implementation	Review of the Artifacts That Guide AI Before Implementation	Verification-First, The New Process	No
“Which tasks and tests we need to develop this also come from the AI.”	P8	Definition of tests before development	Review of the Artifacts That Guide AI Before Implementation	Verification-First, The New Process	No
“A very complete review is needed because it does not always turn out correctly, and I use the LLM itself to make corrections to the PRD.”	P5	Review and AI-assisted correction of the PRD	Review of the Artifacts That Guide AI Before Implementation	Verification-First, Living Knowledge	No
“I review it manually, but I also ask the AI to review it because I may have missed something.”	P5	Combination of human and AI review	Combined Human and AI Review	Verification-First, The New Teams	No
“After the TechSpec, we generate a document or a list of tasks. For a route, we generate the code first and then the unit tests to check whether they pass.”	P6	Derivation of implementation tasks and tests from the TechSpec	Derivation of Implementation and Tests from Specifications	Verification-First, The New Process, Living Knowledge	No
“I used AI planning models to ask the AI to challenge my architecture.”	P1	Use of a planning agent to challenge an architecture	Specialized Agents for Distinct Development Activities	The Extended Workforce, Verification-First	No
“There is an internal AI tool used to diagnose a bug.”	P2	Use of an internal AI agent for bug diagnosis	Specialized Agents for Distinct Development Activities	The Extended Workforce, Verification-First	No
“When you write code, you can use an agent that acts as a code reviewer.”	P9	Use of a specialized code review agent	Specialized Agents for Distinct Development Activities	The Extended Workforce, Verification-First	No
“Following prompt-engineering techniques, building the chain of thought and the context, I also used AI to write this skill.”	p2	AI-assisted creation of a prompt-engineering skill	Creation of Reusable AI Instructions	Living Knowledge, Reusable Blueprints	No
“The agent's plugin in Edge performs this analysis while we are building the story.”	p8	Use of an agent plugin during story construction	Agent Integration with Development Tools	Living Knowledge, The Extended Workforce	No
